

IN THE SPECIFICATION

Please add the following new paragraphs following paragraph [0037]:

C1 [0037.1] Figure 18 illustrates a forearm extension, in accordance with one embodiment of the invention; and

[0037.2] Figure 19 illustrates a forearm extension, in accordance with one embodiment of the invention.

Please replace paragraphs 36, 37, 49, 51, 63 and 64 with the following rewritten paragraph:

C2 [0036] Figures 16a and 16b illustrate a forearm extension, in accordance with one embodiment of the invention; and

[0037] Figures 17a-b, illustrate several views of a bushing used in a second female coupling of the extension arm illustrated in Figures 16a-b, -

C3 [0049] Figures 11a-d illustrate several views of the upper channel 104, according to one embodiment of the invention. The upper channel 104 includes a U-shaped body 130 having a longitudinal axis 188 and integrally cast rollers 132 disposed at opposite ends of the U-shaped body 130. The U-shaped body 130 comprises a channel bottom 180 from which extend two channel sidewalls 182. The channel bottom 180, the sidewalls 182 and the rollers 132 of the upper channel 104 are preferably integrally cast from zinc, which gives the upper channel 104 a lesser weight, and a degree of structural rigidity, more suitable for lighter-weight flat-screen devices than the prior art upper channel 14 which is stamped from heavy gauge steel. The rollers 132 have a hole 184 therethrough (either cast or subsequently drilled) for receiving a connection mechanism, such as the pins 118. Additionally, the upper channel 104 comprises a threaded hole 186 configured and sized to receive a threaded

end of a ball stud 138. The threaded hole 186 is also integrally cast. The ball stud 138 is configured and sized to receive a second end of the gas spring 122.

[0051] Figures 12a-e illustrate several views of the lower channel 106, according to one embodiment of the invention. The lower channel 106 includes a U-shaped body 134 having a longitudinal axis 200 and integrally cast rollers 136 disposed at opposite ends of the U-shaped body 134. The U-shaped body 134 of the lower channel 106 comprises a channel bottom 190 from which extend two channel sidewalls 192. The channel bottom 190, the sidewalls 192 and the rollers 136 of the lower channel 106 are preferably integrally cast from zinc, which gives the lower channel 106 a lesser weight when compared to heavy gauge steel, and a degree of structural rigidity, more suitable for lighter-weight flat-screen devices. The rollers 136 have a hole 194 therethrough (either cast or subsequently drilled) for receiving a connection mechanism, such as the pins 118.

[0063] The embodiment of the forearm extension 110 illustrated in Figures 16a and 16b, has the topwall 207 flush with an upper edge of the female couplings 142, 144. Since the first female coupling 142 is larger than the second female coupling, the center of the first female coupling 142 is not aligned with the center of the second female coupling 144 or an axial centerline 228 of the body 140. It should be noted that an alternative embodiment as shown in Fig. 18 is to have the center of the female couplings 142, 144 and the axial centerline 228 of the body 140 all aligned, so that the topwall 207 would not be aligned with an upper edge of the first female coupling 142.

[0064] The embodiment illustrated in Fig. 16a, has the body 140 horizontally disposed between the female couplings 142, 144 when the axial centerlines of the female couplings 142, 144

cl

Application No.: 10/079,804

Docket No.: INNOFF 3.0-010 DIV

are vertically disposed. It should be noted however that the body 140 is not limited to be horizontally disposed and may be disposed at an incline in this embodiment as shown in Fig. 19.
